Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes

4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example similar) or	NA
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Flood-Prediction-System/

|

└─ app.py

└─ train.py

└─ requirements.txt

└─ README.md

└─ Flood_prediction.csv

|

└─ models/

Field	Details
Hosted / Deployed URL	
Login Credentials (Demo)	Not required

Platform / Hosting Provider	Local Flask Development Server
------------------------------------	--------------------------------

Repository Link	https://github.com/238x1a05b7/Rising-waters
------------------------	---

```

|   ├── flood_model.joblib
|   └── scaler.joblib
|
|   ├── templates/
|   │   └── index.html
|   │
|   │   ├── static/
|   │   │   ├── style.css
|   │   │   ├── script.js
|   │   │   └── images/
|   │
|   │   └── screenshots/

```

Step 3: Deployment / Access Details

Demo Video Link	https://drive.google.com/file/d/12voHom1D8VEkWzhkENZ_ytADWfFXxNZZ/view?usp=drivesdk
------------------------	---

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

1. Download or clone the project from the GitHub repository.
2. Open the project folder in Visual Studio Code.
3. Install the required dependencies using: `pip install -r requirements.txt`

S.No	Known Issue / Limitation	Workaround / Status
------	--------------------------	---------------------

4. Run the Flask application: `python app.py`

5. Open the URL displayed in the terminal (for example, `http://127.0.0.1:5000`).

6. Enter the environmental parameters and click **Predict** to view the flood prediction result.

Step 5: Known Issues / Limitations

1	Prediction accuracy depends on the quality and completeness of the input data.	Can be improved by training with a larger and more diverse dataset.
2	The system uses historical data and does not fetch live weather information.	Future enhancement: Integrate real-time weather APIs.
3	The application currently predicts flood risk only and does not send automatic alerts or notifications.	Future enhancement: Add SMS, email, or mobile push notifications.
